

Accessibility Testing:

My Accessibility Testing on the site CynthiaSays revealed three main issues that I needed to address for my site to be accessible to those with disabilities and impairments. All three of these issues I found to be the most important and obvious changes I needed to make to my site. The issue with contrast is something I never even considered, but is it true that poor contrast is difficult to read for anyone, especially those with vision impairments. With these changes, my site is now WGA 2.0 AA compliant.

At the WGA 2.0 A Compliance level I had an issue with Criterion 1.3.1 [Info and Relationships] – H42 Use h1-h6 to identify headings.

I corrected this issue by going into the index.php code and replaced the `<h1></h1>` brackets around the `<?php the_title(); ?>` php code.

At the WGA 2.0 AA Compliance level I had an issue with Criterion 1.4.3 [Contrast (Minimum)] – G18 Ensuring that a contrast ratio of at least 4.5 : 1.

I changed the font color to pure black and the background to a lighter shade of blue

At the WGA 2.0 AA Compliance level I had an issue with Criterion 1.4.4 [Resize text] - C12 Use percent, em, or named font size for font sizes.

Corrected my code to use named font sizes.
